## IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A method of transferring a data stream comprising:
transferring a plurality of bits associated with a data stream from a data source to a
temporary storage, wherein the data source is designated as the data source based upon the
operation being performed, and wherein the data source with other operations can be classified
as a target data source;

concurrently intercepting during the transfer, each bit associated with the data stream and counting a bit-transfer total and a bit-set total associated with the data stream; and determining if the bit-set total exceeds more than half the bit-transfer total and if so setting an inversion flag bit which is associated with the data stream.

- 2. (Original) The method of claim 1, further comprising:
  transferring from the temporary storage to a target source each bit associated with the
  data stream and concurrently inverting each bit as transferred, if the inversion flag bit is set.
- 3. (Original) The method of claim 1, further comprising: shifting the inversion flag bit to a flag storage.
- 4. (Original) The method of claim 3, further comprising: assembling one or more additional inversion flag bits in the flag storage, each additional inversion flag bit associated with a single additional data stream; and maintaining each additional data stream in the temporary storage.
- 5. (Original) The method of claim 4, further comprising: transferring from the temporary storage to a target source each bit associated with the data stream and each of the additional data streams while concurrently inverting each transferred

bit, if the inversion flag bit associated with a transferred data stream is set, as identified in the flag storage.

- 6. (Original) The method of claim 5, wherein the flag storage is a register.
- 7. (Currently Amended) A method of transferring a data stream, comprising:

  receiving a data stream and an inversion flag associated with the data stream from a data
  source, wherein a classification of the data source is transitory and can be modified to a target
  data source depending upon an operation being performed;

transferring one or more bits associated with the data stream from a data source to a target source, if the inversion flag is unset; and

inverting the bits associated with the data stream as the data stream is transferred from the data source to the target source, if the inversion flag is set.

- 8. (Original) The method of claim 7, wherein the inversion flag and the data stream are stored together in the data source.
- 9. (Original) The method of claim 7, wherein the inversion flag and the data stream are separately stored in the data source.
- 10. (Original) The method of claim 7, wherein the inversion flag is stored with one or more additional inversion flags as a single data structure in the data source, each additional inversion flag associated with an additional data stream.
- 11. (Currently Amended) A computer readable medium having executable instructions for executing a method which is operable to invert transferred data, the method comprising:

acquiring a data stream and an inversion flag from a data source, wherein the data source can also be a target data source depending upon an operation being performed;

separating the data stream and the inversion flag into a data stream storage and an inversion flag storage; and

Title: BIT INVERSION IN MEMORY DEVICES

\_\_\_\_\_\_

buffering one or more additional data streams and one or more additional inversion flags from the data source in the storages.

12. (Original) The medium of claim 11, further comprising:

inverting all bits associated with a transferred data stream as the transferred data stream is sent to a target source from the data stream storage, if a corresponding inversion flag associated with the transferred data stream is set in the inversion flag storage.

13. (Currently Amended) <u>A Functional</u> data <u>structure implemented in a computer readable</u> <u>medium operable</u> to be transferred from a data source, comprising:

a data stream having a plurality of bits;

an inversion bit associated with the data stream which is set after the data stream is transferred to a temporary storage, if a total number of set data stream bits exceeds more than half a total number of bits associated with the data stream, wherein the total numbers are tabulated concurrently as the data stream is transferred to the temporary storage, and wherein the data stream is adapted to be received from a data source and a classification of the data source is dependent upon an operation being performed, and wherein with other operations the data source may be classified as a target data source that is a recipient of the data stream and the inversion bit.

- 14. (Currently Amended) The functional data structure of claim 13, further comprising: an inversion bit stream including the inversion bit and one or more additional inversion bits, each additional inversion bit associated with an additional data stream.
- 15. (Currently Amended) The functional data structure of claim 14, wherein the data stream and the additional data streams are transferred from the temporary storage to a target source, and wherein during the transfer the transferred bits associated with the transferred data stream are inverted if a corresponding inversion bit or additional inversion bit associated with the transferred data stream is set.

Serial Number: 09/944,993 Filing Date: August 30, 2001

Title: BIT INVERSION IN MEMORY DEVICES

16. (Currently Amended) The functional data structure of claim 13, wherein the bits of the data stream are inverted if the inversion bit is set during a transfer of the data stream from the temporary storage to a target source.

- 17. (Currently Amended) An inversion data transfer system, comprising:
  - a data source device;
  - a temporary storage; and

a controller that transfers a data stream having a plurality of bits from the data source device to the temporary storage, and concurrent to the transfer determines if a total number of set bits within the data stream is more than half of a total number of bits associated with the data stream, and if so associating a set inversion bit with the data stream, otherwise associating an unset inversion bit with the data stream, and wherein the data source can also be classified as a target data source when it receives the data stream.

- 18. (Original) The system of claim 17, further comprising:
- a target source device which concurrently receives the bits of the data stream inverted, as the data stream is transferred from the temporary storage, if a set inversion bit associated with the data stream is detected.
- 19. (Original) The system of claim 17, further comprising:
- a register storage operable to house the inversion bit and one or more additional inversion bits, wherein each additional inversion bit is associated with an additional data stream.
- 20. (Original) The system of claim 19, wherein the controller further retrieves from the register storage each inversion bit associated with a transferred data stream and is operable to concurrently transfer the transferred data stream from the temporary storage and invert the bits associated with the transferred data stream if the inversion bit is set.

Dkt: 703.155US1

21. (Currently Amended) An inversion data transfer system, comprising:

a data source device, wherein the classification of the data source device is transitory and can change, based on operations being performed, into a target source device;

the a target source device; and

a controller that acquires a data stream and an inversion bit <u>associated</u> with the data stream from the data source device and inverts bits associated with the data stream during a transfer of the data stream to a target source device, if the inversion bit is set.

22. (Original) The system of claim 21 further comprising:

a temporary storage operable to house the data stream as the data stream is acquired from the data source device; and

a register storage operable to house the inversion bit as the data stream is acquired from the data source device.

- 23. (Currently Amended) The system of claim 21, wherein the controller acquires the inversion bit by stripping the inversion bit from the data stream.
- 24. (Original) The system of claim 21, wherein the controller acquires the inversion bit as a separate data structure having one or more additional inversion bits with each additional inversion bit being associated with a single additional data stream.
- 25. (Currently Amended) A system for transferring a data stream, comprising:
  - a control buffer;
  - a storage buffer;
  - an inversion storage;

a counting set of executable instructions operable to count set bits associated with a data stream being received from the control buffer into the storage buffer as the storage buffer receives the data stream from a data source and a designation of the data source is determined based on an operation that delivers the data stream to the storage buffer and wherein other operations can designate the data source as a target data source that receives the data stream, and

the data stream.

the counting set of executable instructions further operable to generate an inversion bit associated with the data stream, wherein the inversion bit is housed in the inversion storage and is set if a total number of set bits exceeds more than half a total number of bits associated with

26. (Original) The system of claim 25, further comprising:

a transfer set of executable instructions operable to use the counting set of executable instructions to transfer the data stream from the storage buffer to a target device, wherein the entire data stream is inverted if the inversion bit is set as the data stream is being transferred to the target device.

- 27. (Original) The system of claim 26, wherein the inversion bit is transferred with the data stream to the target device.
- 28. (Original) A memory apparatus, comprising:

a controller that acquires a data packet and an associated inversion bit and is operable to transfer the packet and concurrently invert the packet if the inversion bit is set.

- 29. (Original) The apparatus of claim 28, wherein the controller buffers the packet prior to transfer.
- 30. (Original) The apparatus of claim 29, wherein the controller separates the packet and the inversion bit.
- 31. (Original) The apparatus of claim 30, wherein the inversion bit is housed in a register prior to the transfer.
- 32. (Original) The apparatus of claim 28, wherein the controller acquires the inversion bit by counting set bits associated with the data packet, as the packet is acquired.

Title: BIT INVERSION IN MEMORY DEVICES

- 33. (Currently Amended) A memory apparatus, comprising:
  - an inversion bit;
  - a data packet;
- a state machine that controls the transfer of the data packet to a target device wherein the packet is inverted as it is transferred to the target device, if the inversion bit is set, and wherein a designation of the target device is transitory and resolved based on an operation being performed and with other operations the target device can also be a data source device.
- 34. (Original) The apparatus of claim 33, further comprising: a buffer to house the data packet prior to transfer to the target device; and a register to house the inversion bit.
- 35. (Original) The apparatus of claim 33, wherein the state machine is configured by interfacing one or more electro-mechanical devices.
- 36. (Original) The apparatus of claim 33, wherein the state machine is configured using a set of executable instructions.
- 37. (Original) The apparatus of claim 33, wherein the data packet is a fixed length data packet.
- 38. (Original) The apparatus of claim 33, wherein the data packet is a variable length data packet.
- 39. (Original) The apparatus of claim 33, wherein the apparatus is a flash memory device.
- 40. (Currently Amended) A flash memory device, comprising:
  - a temporary storage;
  - a receiving controller;
  - a counting controller; and

**AMENDMENT AND RESPONSE UNDER 37 CFR § 1.111** 

Serial Number: 09/944,993 Filing Date: August 30, 2001

Title: BIT INVERSION IN MEMORY DEVICES

Page 9 Dkt: 703.155US1

a transferring controller that transfers a data packet received by the receiving controller in

a temporary storage to a target device and further inverts the data packet during the transfer if the

counting controller indicates to the transferring controller that the packet requires inversion, and

wherein the data packet is initially received from a data source and a designation of the data

source is transitory based on an operation being performed and with other operations the data

source can also be designated as the target device.

41. (Original) The flash memory device of claim 40, wherein the counting controller

indicates the packet requires inversion if a total number of set bits associated with the packet

exceeds more than half a total number of bits associated with the packet.

42. (Original) The flash memory device of claim 40, wherein the memory device is at least

one of a compact flash memory card and a multimedia card.

43. (Original) The flash memory device of claim 40, wherein the memory device is included

in the operation of a at least one of a digital camera device, digital video device, and a portable

audio player device.

44. (Original) The flash memory device of claim 40, wherein the counting controller

includes a packet based ones counter.

45. (Original) The flash memory device of claim 40, further comprising a shift-load register

used to house an inversion bit generated by the counting controller, wherein the inversion bit, if

set, indicates the data packet is to be inverted.

46. (Original) The flash memory device of claim 45, wherein one or more multiplexers, the

shift-load register, and the temporary storage are used by the transferring controller to transfer

the data packet.
